PROJECT-

Wiki app- Web app for storing factual data about things similar to wikipedia. User can add/edit entries. The web app contents need to be added using markdown language which is similar to wikipedia's markup. These entries are then visible on the main page for others to view/search and refer to by clicking the various topics available on the home page.

E-Commerce app- Application where user's can post items to auction and sell it to the highest bidder, Check other items on auction's, add them to their wishlist, post comments etc.

Mail app- Single page mail application with TypeScript on the front-end. Mail app similar to other mail application allowing users to register themselves and then use it to communicate other users who are also registered on the app. Users have access to inbox, archive, compose and sent fields.

Social app- Social app based on react on the front-end and django on the backend where user's have facility to add their posts with images, edit posts, follow other user, receive following user posts, like, comment and more.
